

How I want to get around in 2050... by Tyler Kuszner

The future is clean! No need for pollution from fuels that destroy Earth's fragile environment. No need to deplete Earth's limited natural resources. No need for wasted travel time.

"How is this possible?" you wonder. It is actually quite simple; in 30 years, virtual reality will have advanced so much that people will not have to leave home to travel. Much like how Walt Disney World transports its guests through its rides and attractions, people will simply type their destination of choice into a device. They will experience the temperature, weather, smells, sounds, sights, and even the sensations as if they were actually there.

When people want to reach a destination, they just use their device. They can instantaneously go from Alaska to the equator to Russia and back to the U.S. These devices will be powered by solar power, so they don't even use electricity. The future is clean. The future is green. Don't blink! The future is coming- and the future is virtual.
